

Autotrack DeviceComm for Production Counting

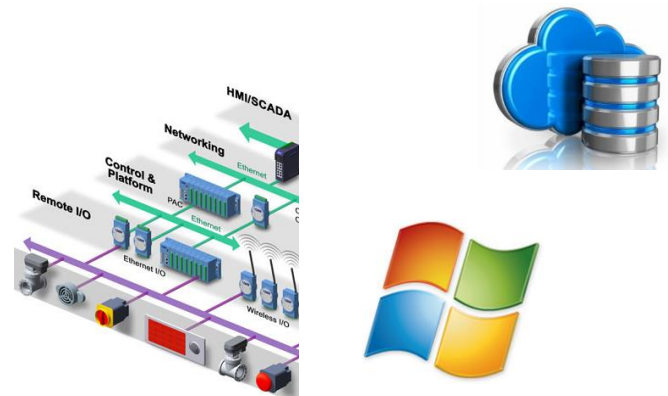

What is DeviceComm?

Devicecomm is a communication software between customer existing data capturing devices with Autotrack. As we know communication is one of the most challenging technologies for today manufacturing industries. The technology involves the technology created during year 1960+ with today latest WiFi and Bluetooth communication. Autotrack DeviceComm is the intelligent software program to communicate with our customer existing industry device with Autotrack SQL database. We capture the relay signal, data signal, and record as well as process the data we manage to capture. At the same time, with programmable logic build inside the Autotrack, the client device or directly center control system will be able to send out signal to various 3 parties device include PLC, strobe light and etc.

Key Benefits

- Reduce Infrastructure Complexity
- Reduce communication risk
- Increase store and purchaser productivity
- Delivery instant data
- Rapidly respond to high demand operation
- Improve operational efficiency
- Improve business agility
- Lower total cost of ownership
- Totally eliminate human intervention
- Easy to use and light weight
