Picture show how the ASTMS

Autotrack stock take management studio (ASTMS) is running at the back-end PC to allow administrator user to manage their data. ASTMS have a function to link with various type of item master from customer exiting inventory program with bin locations and current quantity. This back-end program allow user to have a clear view on the individual Bin stock and make a detail plan on stock take process as well as man power allocation. It link to your exiting inventory system via direct or ODBC connection.

Picture show how the ATC.

Autotrack terminal client (ATC) is a client program running at the mobile computer. It depend on the type of mobile computer you select. Minimum level of customization will be done once only base on customer preference for the first time. Once the user start to routine the process, it should be able to reduce the lost on the stock inventory. WiFi mobile terminal required for this process and the customer store must be fully covered with WiFi.

*Remark: The different between stock take and stock check is base on the process to classify this process and the frequency of the action. Inventory manager will determine the process and classify the activity.

*Remark: Pre-requisite for the stock take to be done is customer need to have a proper barcoding system in their warehouse.
