

# Autotrack On Demand Stock Issue Solution

In the warehouse management solution, stock issue is purely inventory action which will not link to accounting system. It happens mainly in the situation where the tracking system is purely for warehouse use and will not be submitted to the accounting department. The user uses mainly stock issue for in-house tracking purposes only. Examples of stock issue include additive to the production material, consumable tools or material, disposable material for production.

Warehouse stock issue always happens in the situation when the warehouse manager would like to transfer from warehouse A to warehouse B, from warehouse A to the production floor and etc. The tracking is not counted into accounting and no money value is involved for this action. An account side may charge between the department or intercompany fee in terms of a lump sum. Stock issue is not an accounting action; it may cause inaccuracy on the full set of accounting because it did not bring into consideration of time and space factors in the inventory.

The Autotrack team knows the requirements of most of the Small and Medium Industry in the country who are working on production in a smaller scale. Tracking cost in some situations will be costlier than the no-value inventory transfer. We design based on customer demand our mobile stock issue module to simplify the tracking of stock issue activity. You just need to log in to the terminal, select the recipients

warehouse/location, start scanning the issue product and enter the quantity taken out from the store.

It is so simple, our Autotrack mobilecomm will take care of the data transfer in between the mobile computer and your existing ERP or warehousing solution. It gives you peace of mind on your transferring action. Wait no more, give us a call to see how our Autotrack On Demand Stock Issue solution can help your production and internal warehouse.
