Picture show how the ATC.

Autotrack terminal client (ATC) is a client program running at the mobile computer. It depend on the type of mobile computer you select. Minimum level of customization will be done once only base on customer preference for the first time. Once the user start to routine the process, it should be able to reduce the lost on the stock inventory.

The different between stock take and stock check is base on the process to classify this process and the frequency of the action. Inventory manager will determine the process and classify the activity.

Pre-requisite for the stock take to be done is customer need to have a proper barcoding system in their warehouse.
